

Conservation agriculture in rice cropping systems in Madagascar: sustainability and adoption

OBJECTIFS

The aim was to improve the sustainability of production systems, by the implementation of conservation farming systems and the analysis of the socio-economic constraints to the adoption of CA at the farm level. In addition, the project focuses on the capacity building of Southern partners, through the training of high-level students (Masters, PhD students and post-doctoral fellows) and the support to the Doctoral School A2E - "Agriculture, Ecosystèmes, Environnement".

RESULTATS

- Grants for two Masters students (16 months), five PhD students (29 months) and one post-doctoral student (5 months) to study in Montpellier ;
- Participation of French researchers and teachers in training (Doctoral School A2E - "Agriculture, Ecosystèmes, Environnement"; Summer School "Les services écosystémiques rendus par les sols");
- Organization of an International Conference (Agroecology for Africa - AfA 2014)
- Support for research activities of various partners of the Research Partnership "Systèmes de Production d'Altitude et Durabilité à Madagascar" (DP SPAD), interinstitutional scientific platform on highland agricultural systems and sustainability.
- Production of podcast videos on agroecology.

PERSPECTIVES

A better knowledge on bio-functioning of soils to increase their fertility and on socio-economic analysis of farmer systems to promote the most adapted CA systems is still a subject of concern. Studies on soil ecological processes (i.e. soil functions) and on the belowground biodiversity were initiated during the CARIM Project. Other studies were already initiated by other Agropolis Fondation projects in Madagascar, i.e. INDICE and SECuRE, to increase both agronomic, socio-economic and agroecological performances of agrosystems.
